Force

Types of forces

Key words

1. Force - A push or pull acting on an object.
2. Force of gravity - The force that pulls every object downward towards the centre of Earth.
3. Force of friction - The force that acts between the object and the surface.

Q. D Short answer questions!

1. Define force.

Ans A push or a pull is called force.

2. Name four types of force.

Ans Gravitational force, Muscular, frictional force, Magnetic force.

3. Name two metals that are attracted by a magnet.

Ans Iron and nickel.

4. Differentiate between push and pull?

Ans Push means moving object away from us and pull means moving object toward us.

5. Name the force involved while running.

Ans Frictional force.

2. Explain the effects of force on an object with suitable examples

Ans

Moving a object	Stopping a object	Change the direction of movement of object	Change the shape and size of object
An object can be moved by applying force on it	A moving object can be stopped by applying force on it	The direction of a moving object can be changed by applying force on it	The shape of an object can be changed by applying force on it
Ex-A man moves a broken car by pushing it	Ex-A kid stops moving ball by catching it	Ex-A batsman changes the direction of a ball by hitting it with his bat	Ex-A lump of clay can be moulded into different shapes

S.E

1. Explain why a ball rolling on a ground, comes to rest after some time.

Ans

Frictional force always acts in the direction opposite to the direction of moving object. Friction slows down a moving object or completely stops it from moving.

3. Ravi's parents bought a new study table for him. He is trying hard to change its position but is unable to do so. Identify the force acting here.

Ans

A magnet has the capacity to attract certain metals towards itself. The force with which a magnet attracts certain metals, such as iron and nickel, towards itself is called magnetic force.
